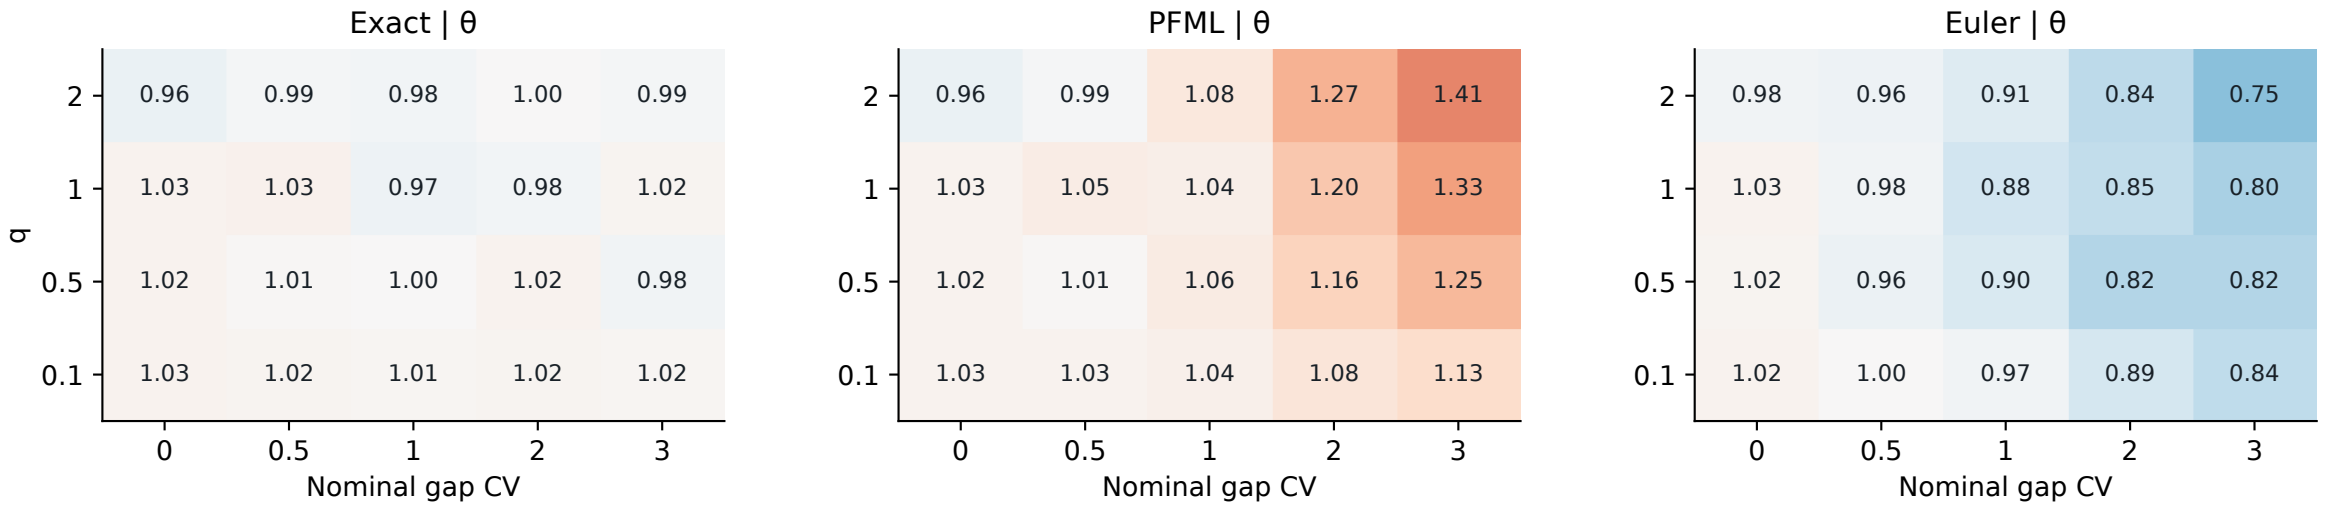
S Empirical variability / reported uncertainty | E2 n = 1,000

Descriptive ratio: empirical SD / RMS reported SE, using the same interval-valid subset



Cell text gives the full ratio rounded to two decimals. Blue: <1; white: 1; red: >1; color saturates at 0.5 and 2.
This is a descriptive calibration diagnostic, without a derived ratio confidence interval or long-run covariance benchmark.
It does not explain coverage by itself: bias, distribution shape and interval construction also matter. Counts are in calibration.csv.
