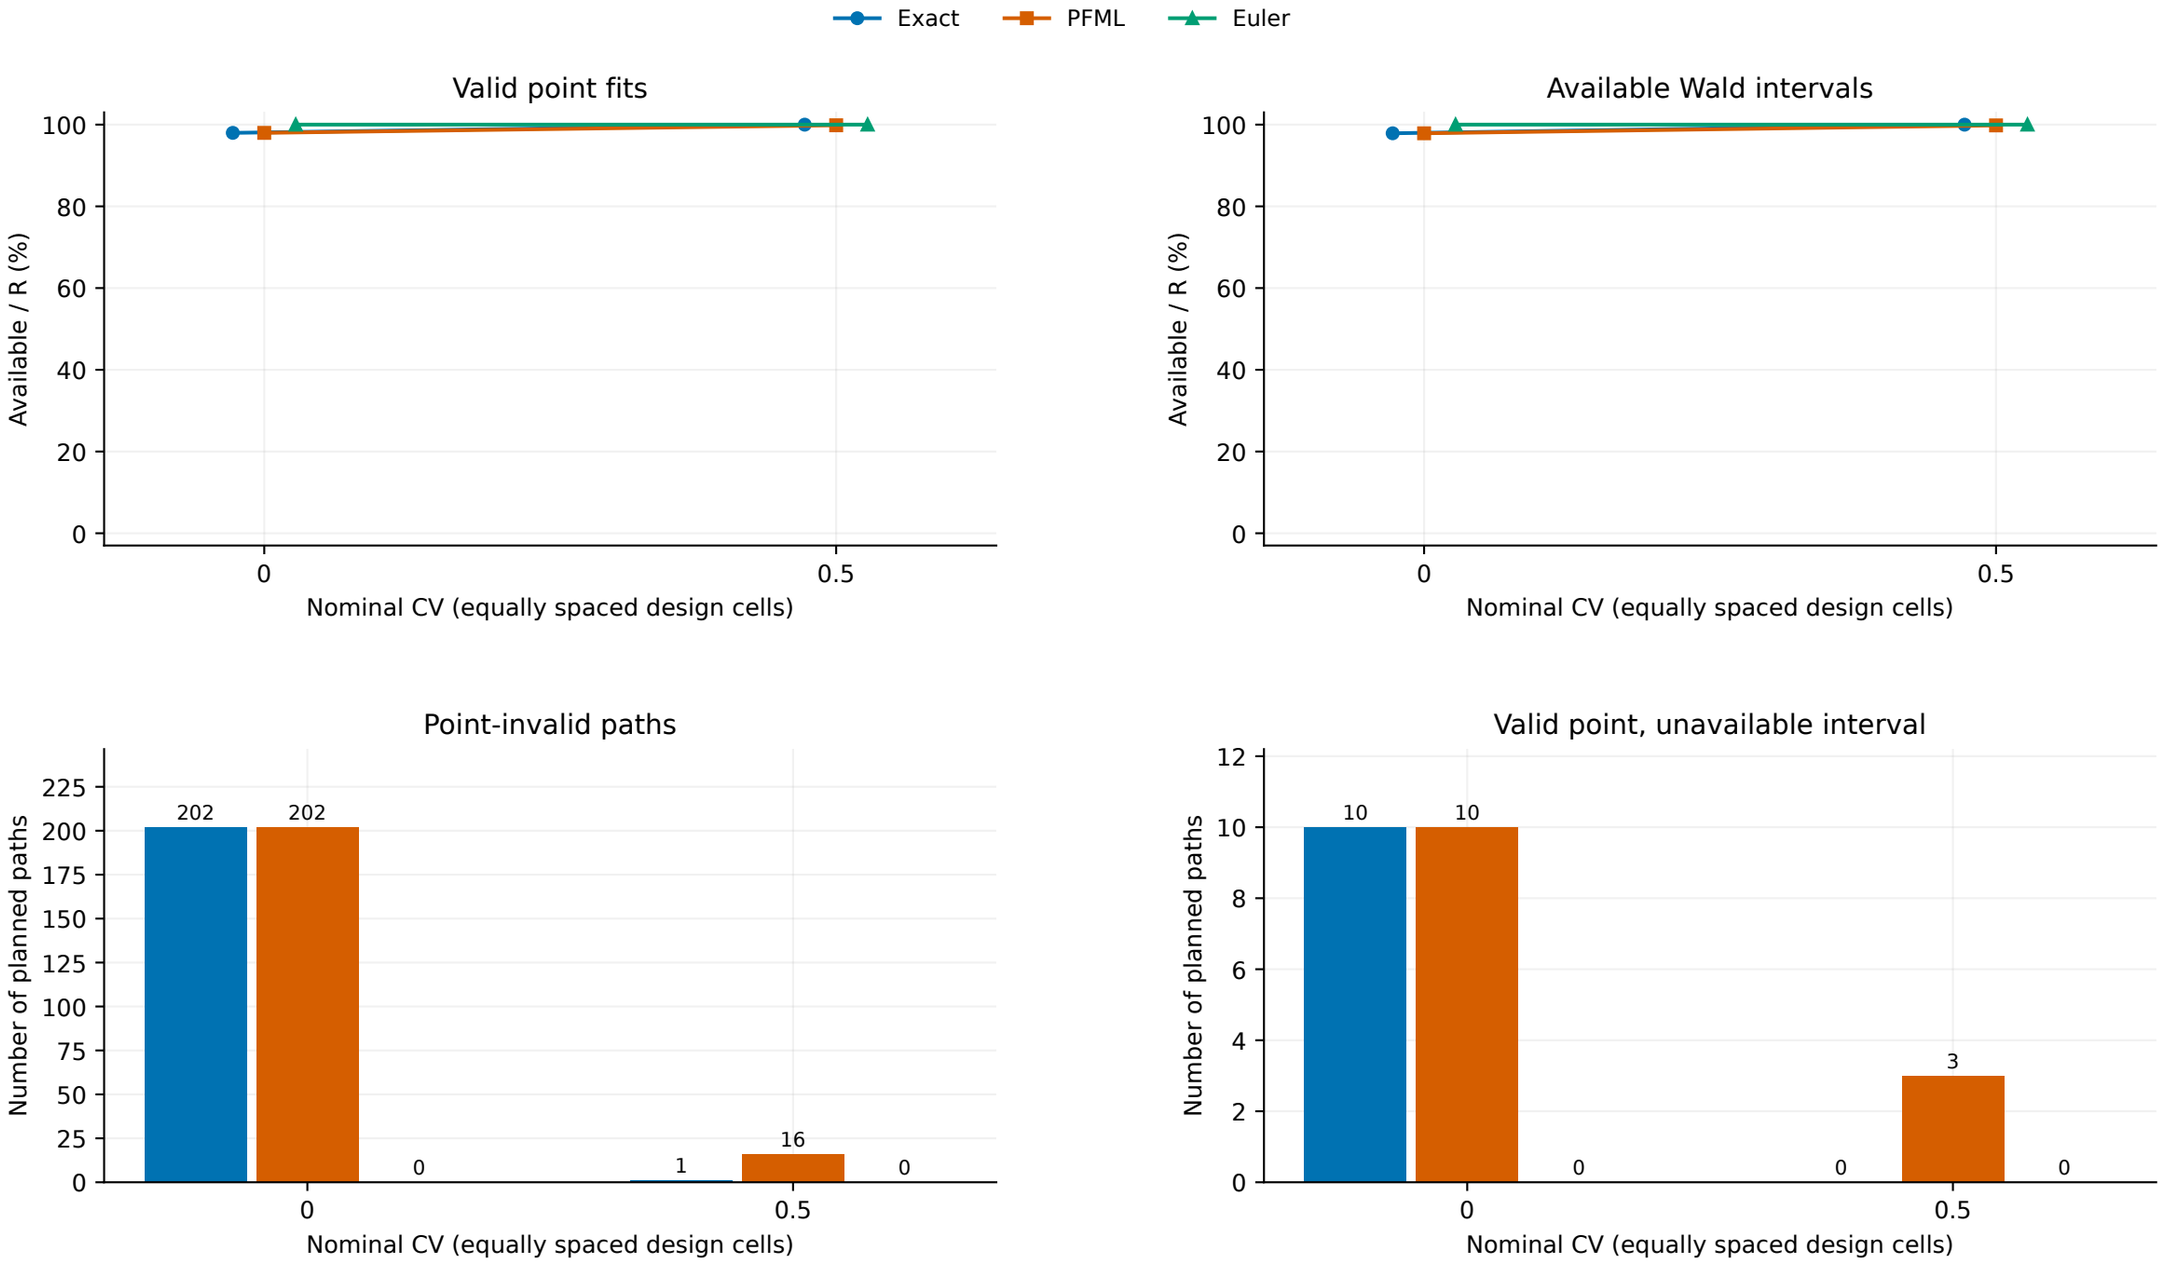
Week 7 Availability and retained failures

EXPLORATORY E3 | q=2, n=250 observations | R=10,000 per independent CV cell



Top: joint point/interval availability with pointwise 95% Wilson intervals. Bottom counts are disjoint categories, each counted once per method.
Point-invalid + valid-point/interval-unavailable = all unavailable intervals. Counts are not tripled across the three parameter rows.
Zero-height bars are explicitly labelled 0. Statistical failures and their finite candidates remain in the saved records.
