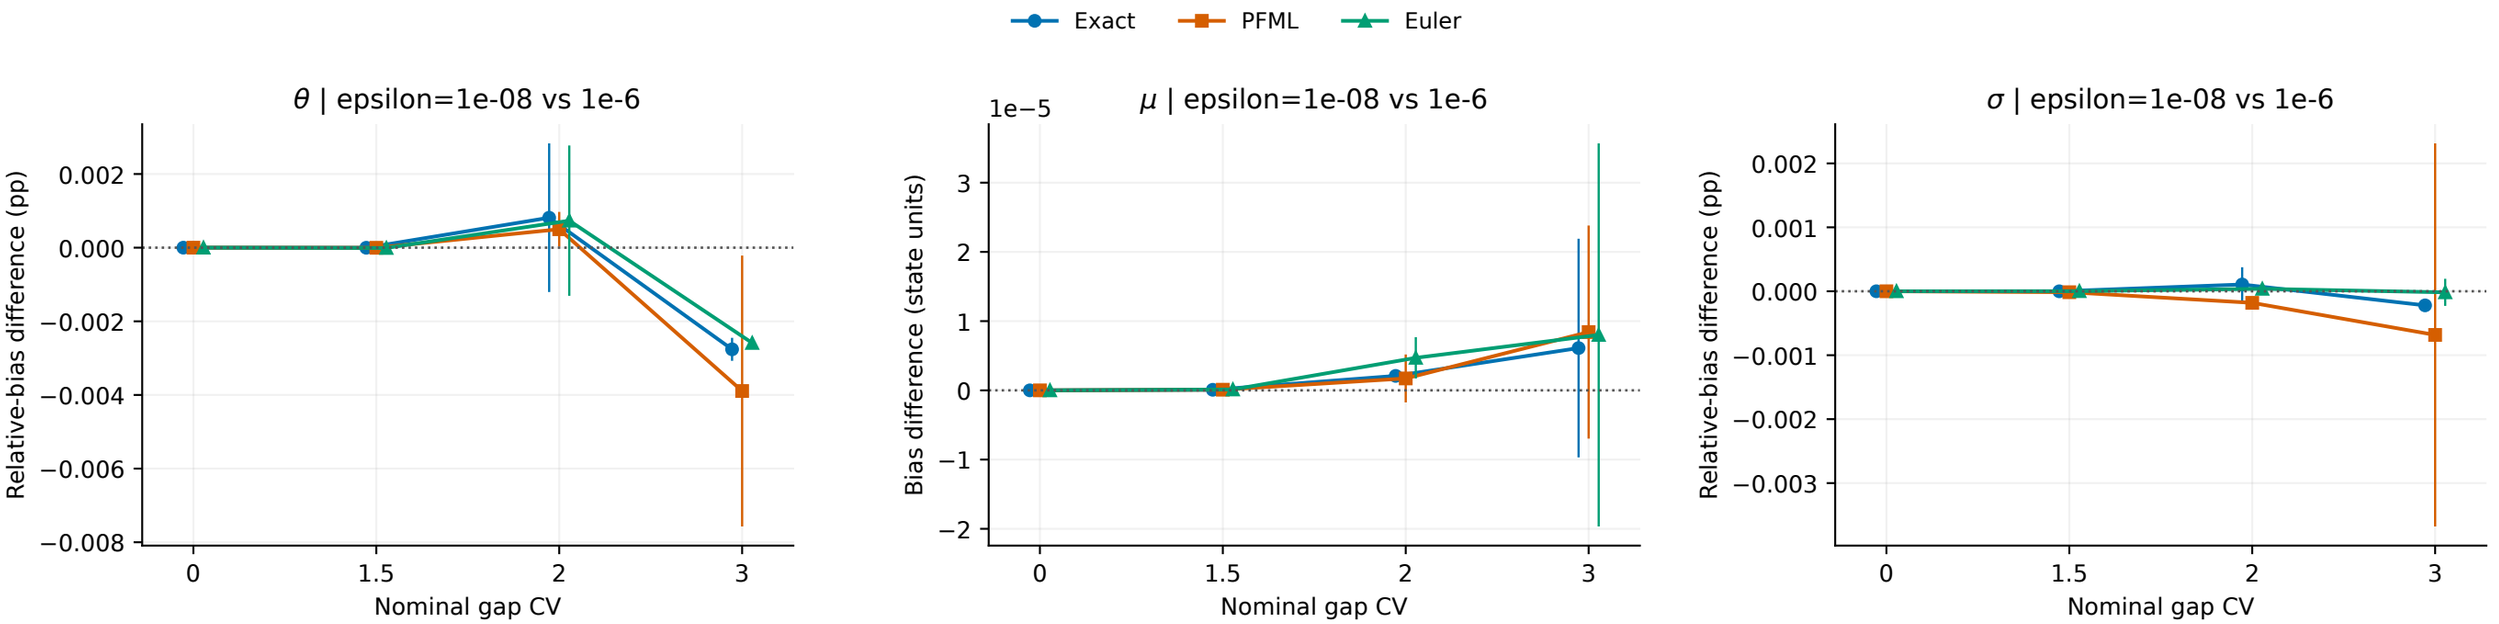
Week 7 Paired floor effects on estimation bias

VALIDATION ONLY | q=0.5, n=1,000 observations | R=2 per physical floor variant



Bars: approximate pointwise 95% paired Monte Carlo intervals; both metrics use the same common-valid point subset.
Theta/sigma bias differences are percentage points of truth-relative bias; mu uses absolute units. No practical-breach threshold applies to a contrast.
CV=0 is one shared control. NA labels mark undefined estimates; absent bars mark undefined uncertainty.
Common-valid S, in Exact/PFML/Euler order (all parameter rows share these counts):
epsilon=1e-08: CV=0: 2/2/2 | CV=1.5: 2/2/2 | CV=2: 2/2/2 | CV=3: 2/2/2
epsilon=0.0001: CV=0: 2/2/2 | CV=1.5: 2/2/2 | CV=2: 2/2/2 | CV=3: 2/2/2
