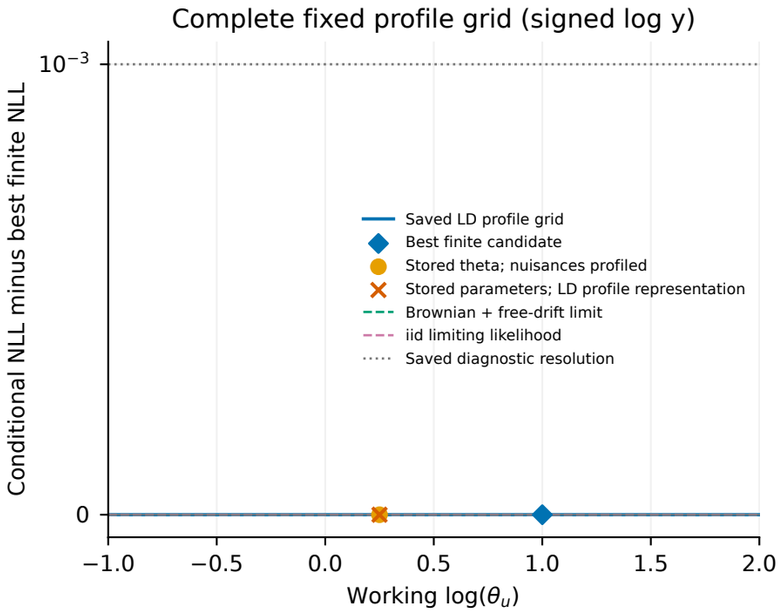
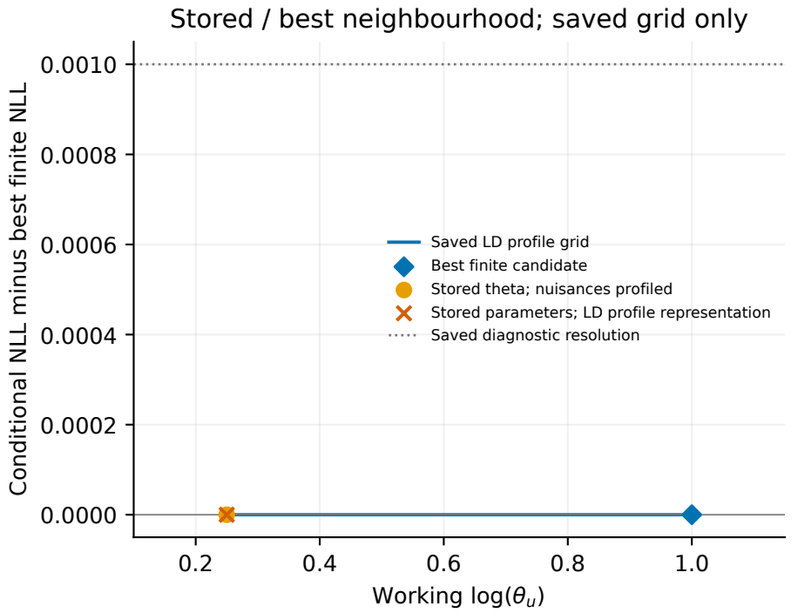
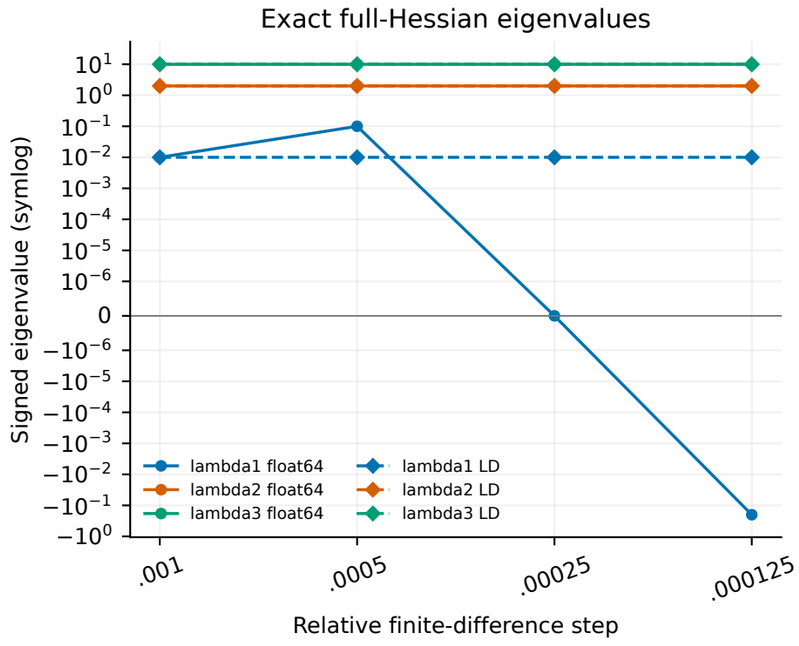
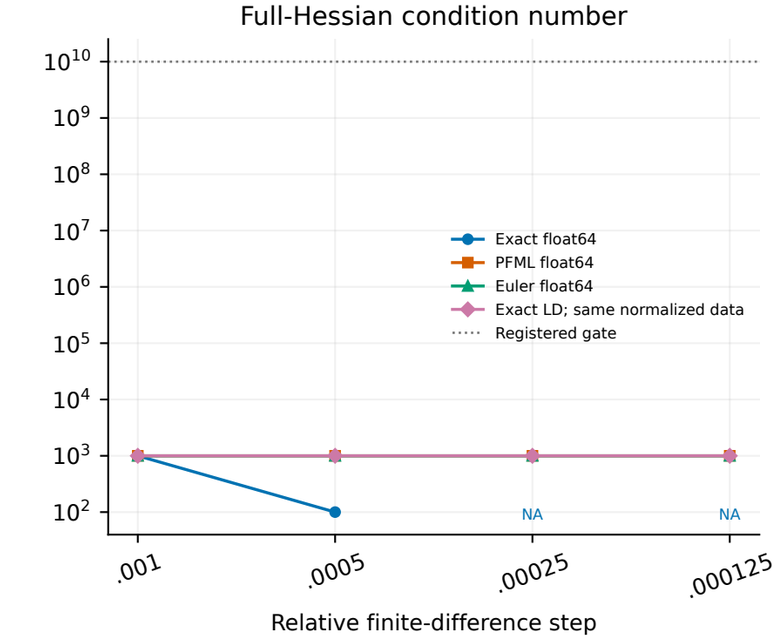
Week 7 Fixed E2 case: CV=0.5, replication 465

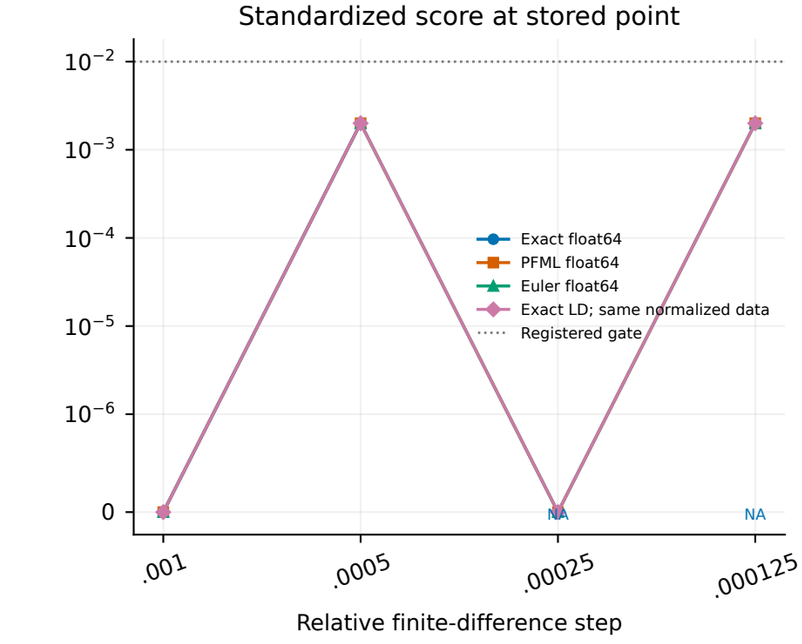
LITERAL VALIDATION FIXTURE — not an original E2 replay | q=2, n=250

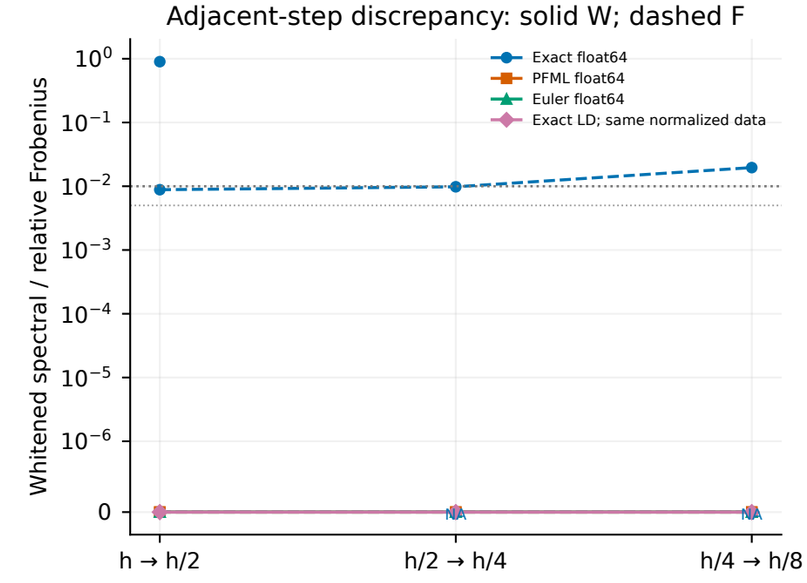












Original exact point/interval status: valid_interior / step_disagreement. No replacement fit, interval or covariance.
Saved longdouble: 64 significant binary digits (63 fraction bits), 16 storage bytes; not arbitrary precision.
Registered Hessian ladders use identical float64-normalized inputs; the LD profile normalizes original values/gaps separately.
Saved representation differences: max |delta value|=2e-17; max |delta gap|=3e-17.
Saved resolution=0.001; lower/upper tail targets reached: False/False. cap limited tail unresolved
Finite searches do not prove a global optimum. Negative saved objective differences are retained, not clipped.
The registered h/h2 procedure determines original interval validity; finer diagnostic steps do not replace it. W gate=.01; F gate=.005; score gate=.01.
