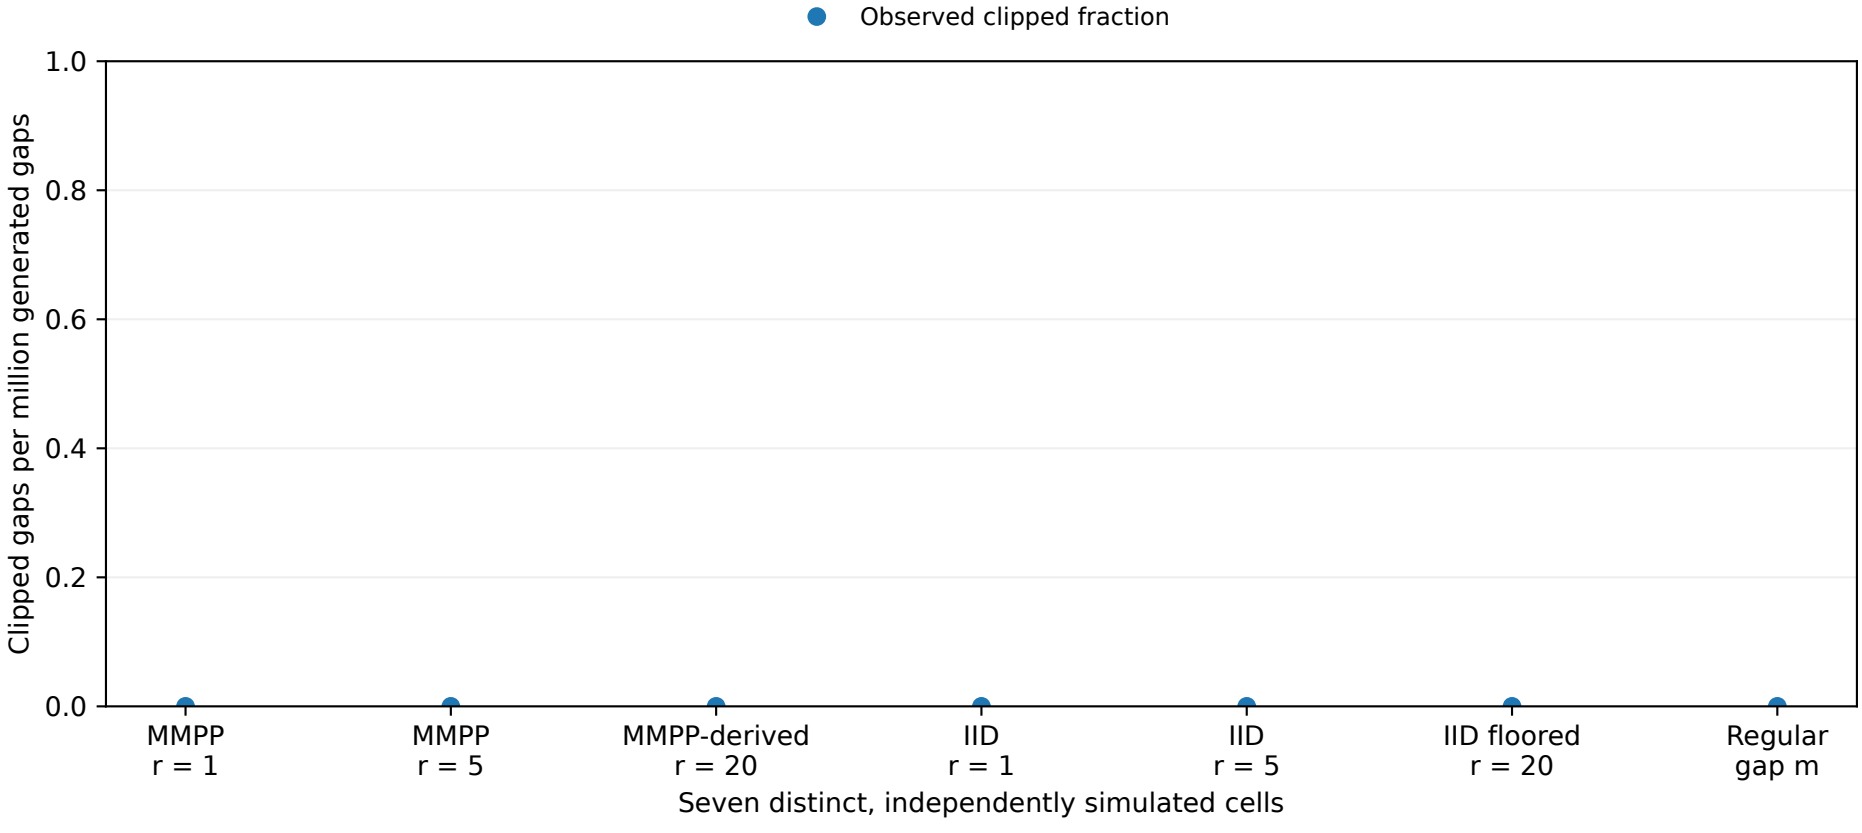
Observed posthoc floor clipping

VALIDATION ONLY — not E4 results | R = 4 per cell | n = 1,000 | θm = 0.5



Clip counts in displayed cell order: 0, 0, 0, 0, 0, 0, 0; each cell contains 3,996 generated gaps. No binomial interval treats dependent MMPP gaps as independent. Only r = 20 has a positive floor (10^{-6}m); zero observed clips is not evidence of zero clipping probability. Full raw, transformed and stored-time diagnostics remain in source_summary.csv.
