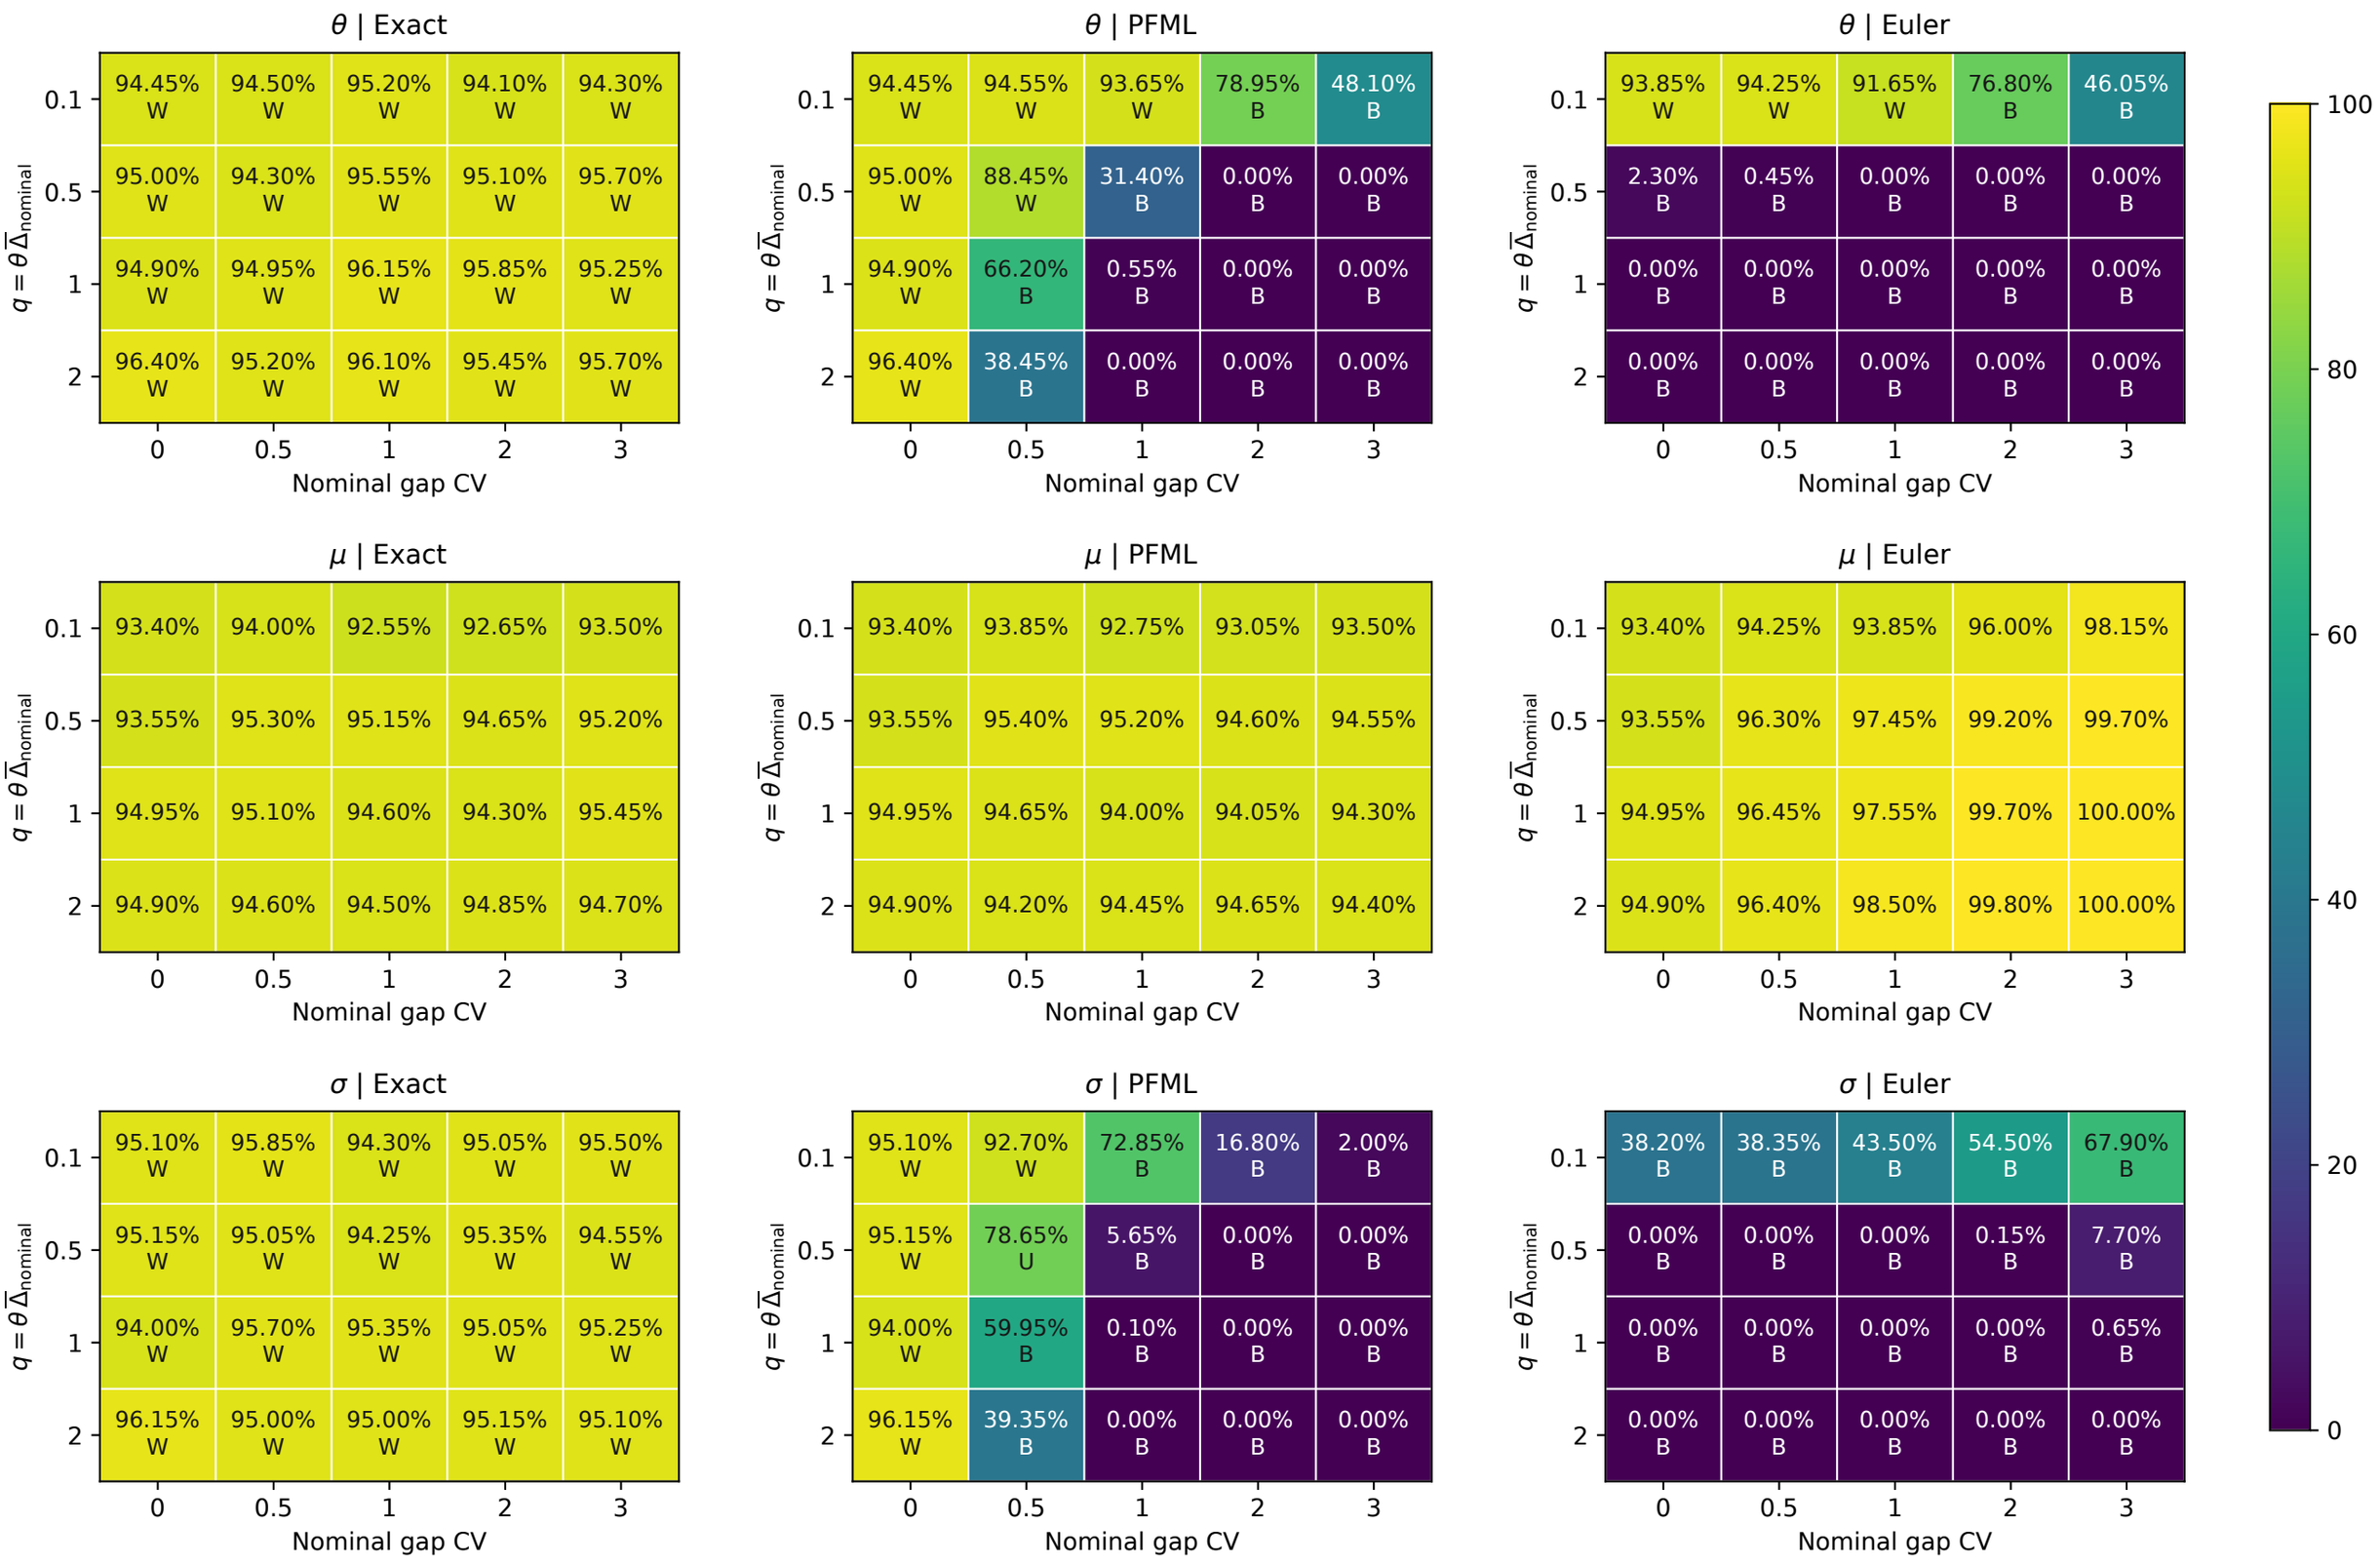
F5 Operational coverage and practical classifications

REGISTERED E2 | n = 1,000 observations | R = 2,000 per (q, CV) cell



Operational coverage: all planned paths; unavailable intervals count as noncoverage. Colors show point estimates on a fixed 0–100% scale.
W = within criteria; B = supported breach; U = unresolved. These pointwise labels combine operational-coverage Wilson bounds AND relative-bias MC intervals.
A breach can therefore reflect bias even with high coverage. Mu has zero truth and no relative-bias classification. Complete uncertainty is in the saved tables.
Intervals are nominal 95% natural-scale Wald intervals; PFML/Euler covariance is model-based. Discrete grid cells do not define a smooth or simultaneous boundary.
