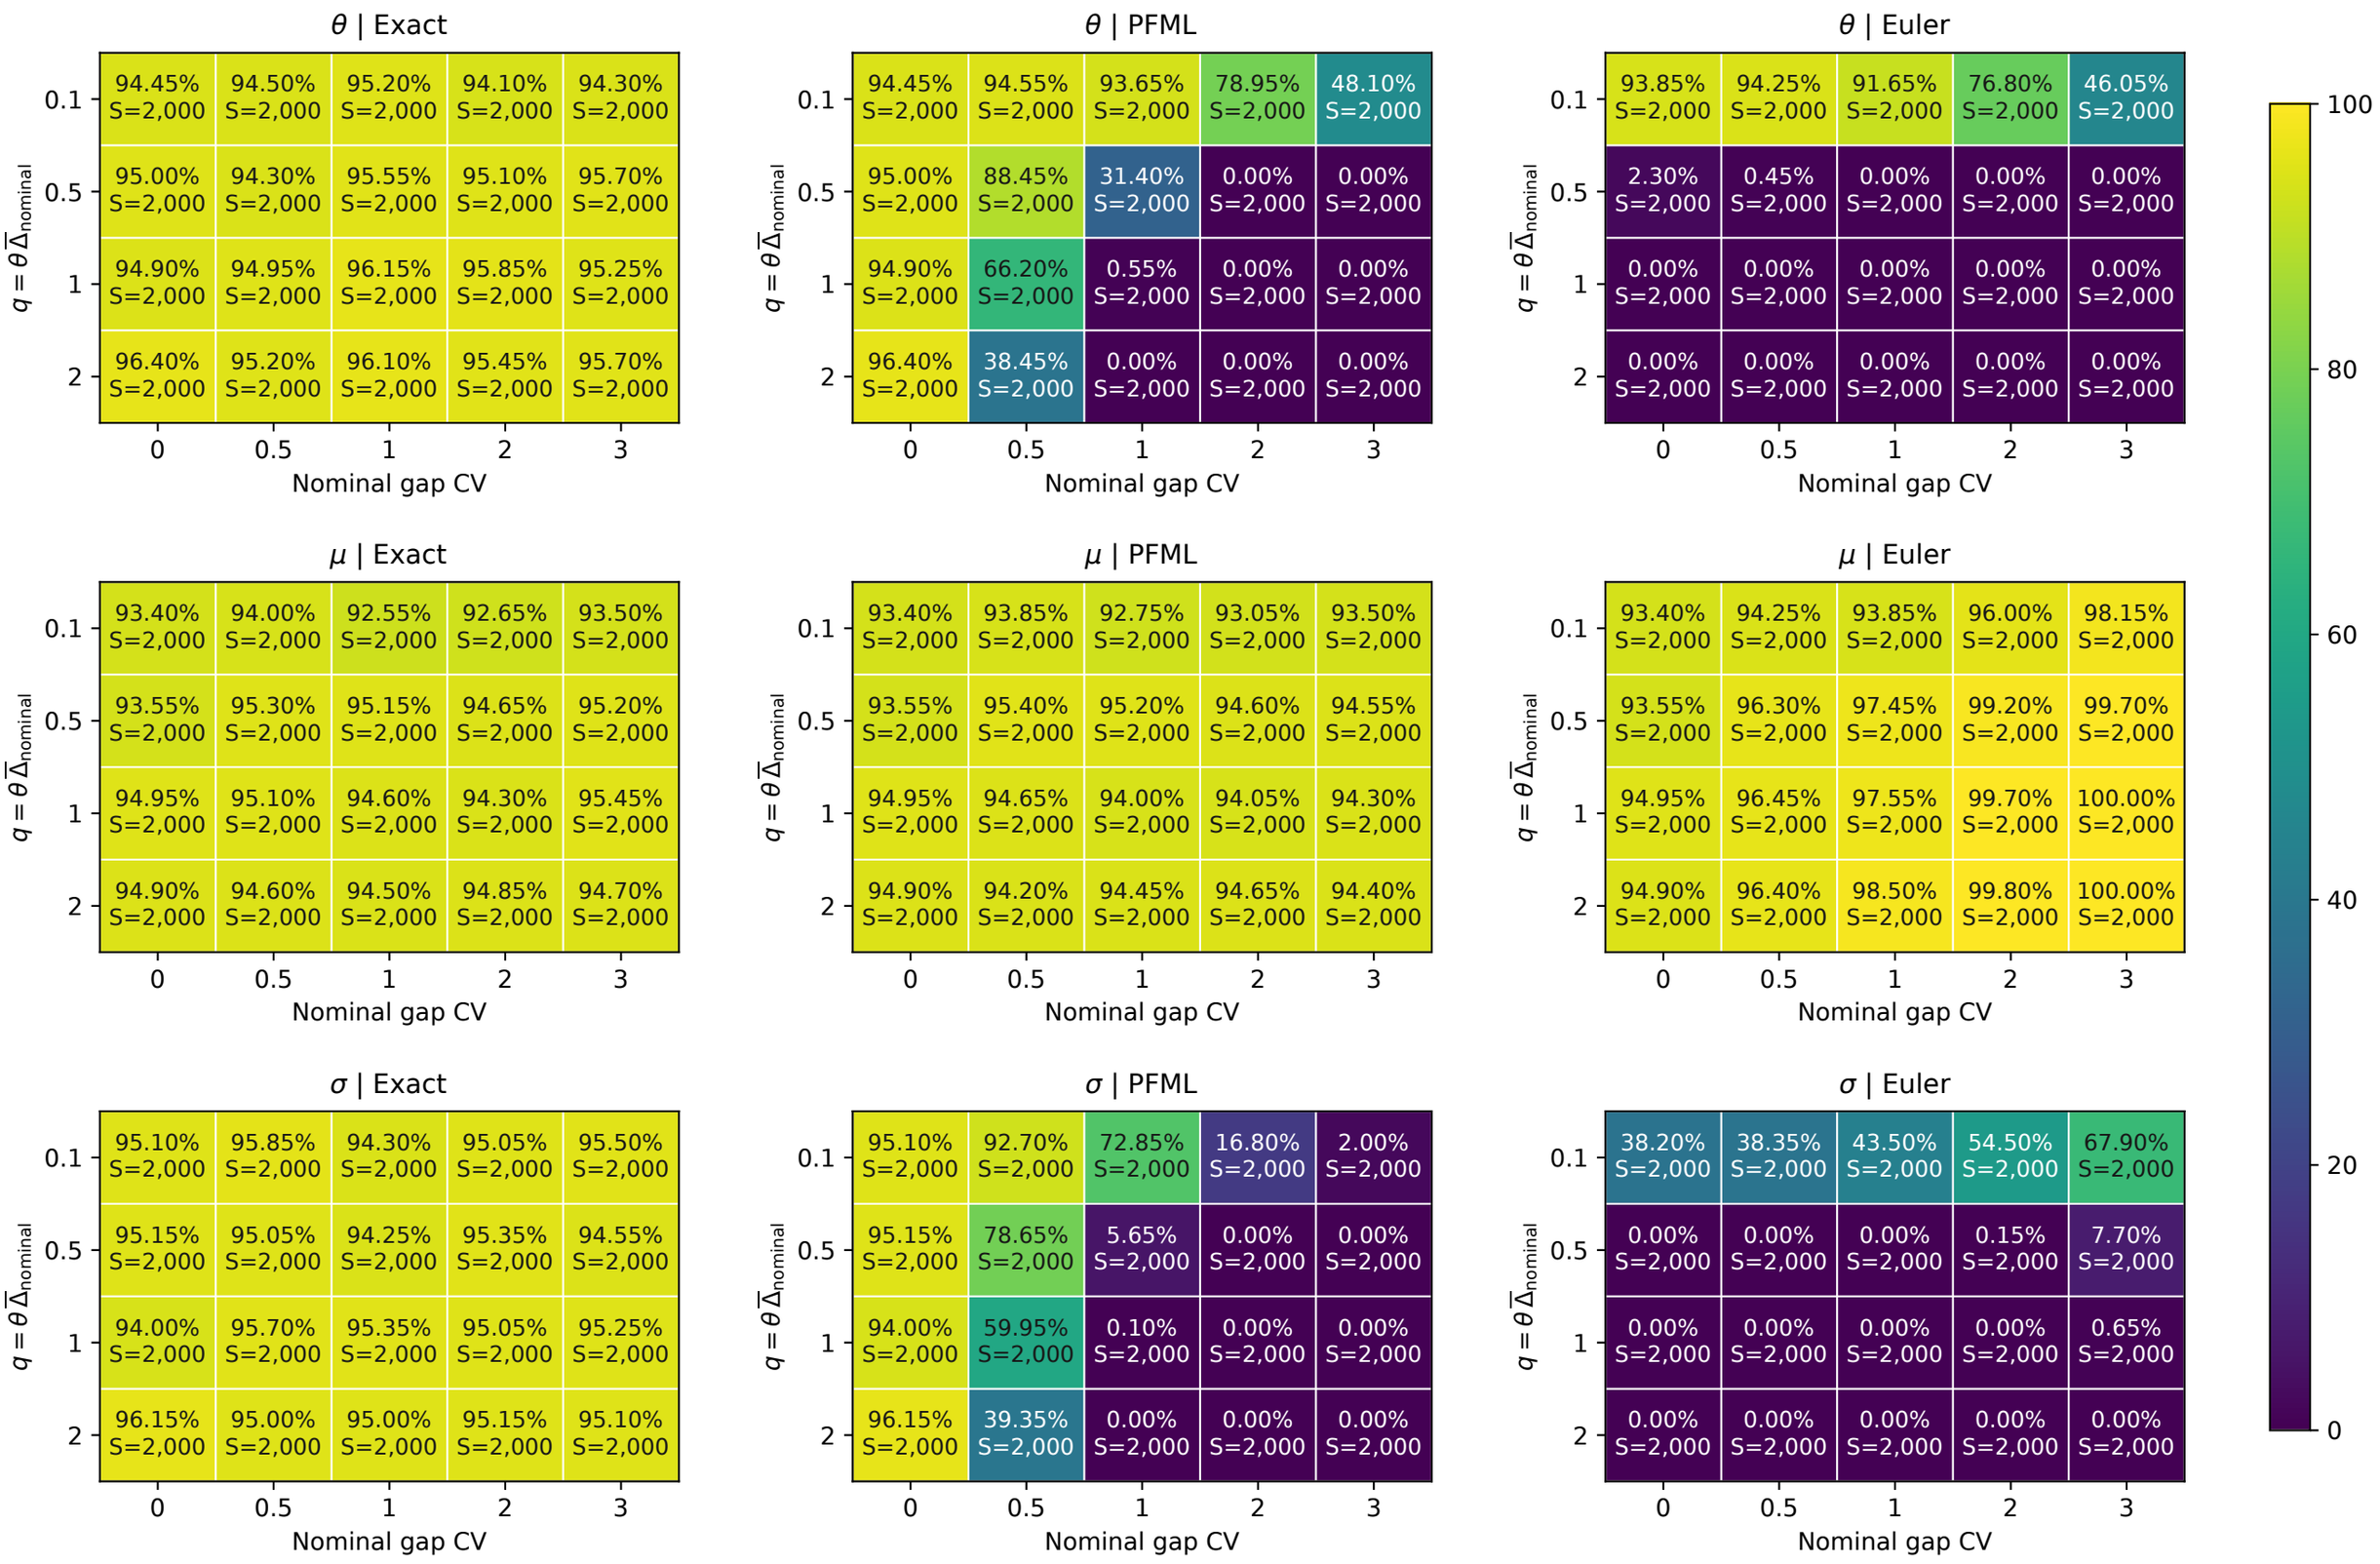
F6 Coverage conditional on available intervals

REGISTERED E2 | n = 1,000 observations | R = 2,000 per (q, CV) cell



Conditional coverage: covering intervals / S valid intervals. S is shown in every cell; NA with gray fill means S = 0. A colored 0.00% means S > 0 and no coverage.
Every planned q/CV cell is retained. Compare with operational coverage and availability; conditioning on valid intervals can select a different subset.
Intervals are nominal 95% symmetric natural-scale Wald intervals; PFML/Euler use model-based inverse-Hessian covariance.
Saved tables retain pointwise Wilson Monte Carlo intervals. Colors show estimates, without interpolation or simultaneous guarantees.
