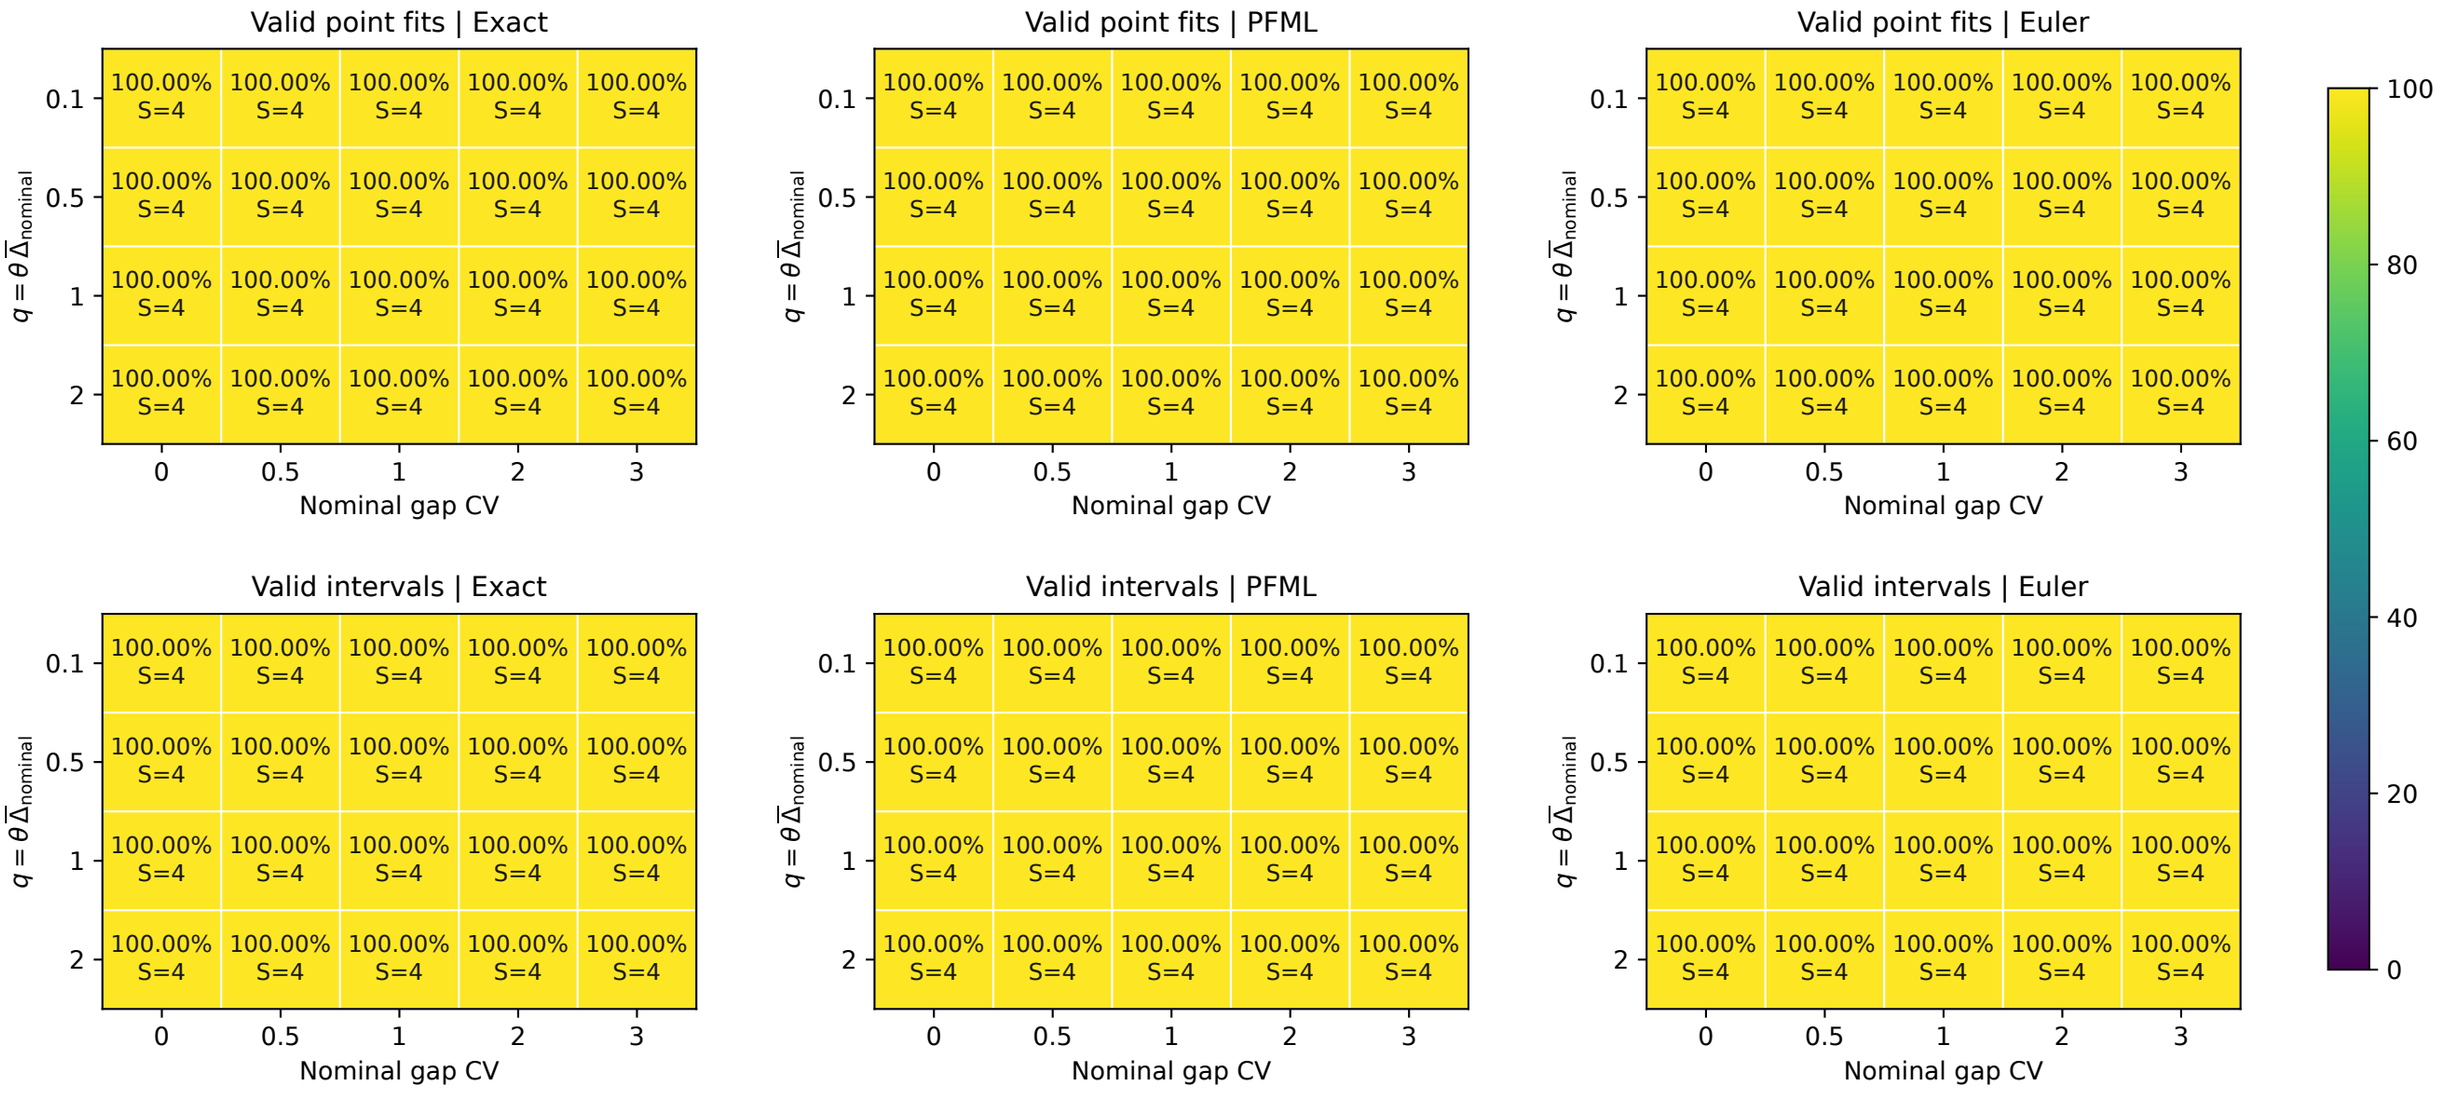
F6 companion Point-fit and interval availability

VALIDATION ONLY | n = 1,000 observations | R = 4 per (q, CV) cell



Availability: valid count / all planned paths. S is the valid count for the indicated row. Point and interval validity are joint across theta, mu and sigma.
An interval can be unavailable despite a valid point fit. These categories overlap; do not add point-invalid and interval-unavailable counts.
Numerical unavailability differs from statistical noncoverage. The complete failed-cell report retains every cell/method, including zero-failure rows.
Colors use the same fixed 0–100% scale. Saved tables retain pointwise Wilson Monte Carlo intervals and detailed outcome counts.
