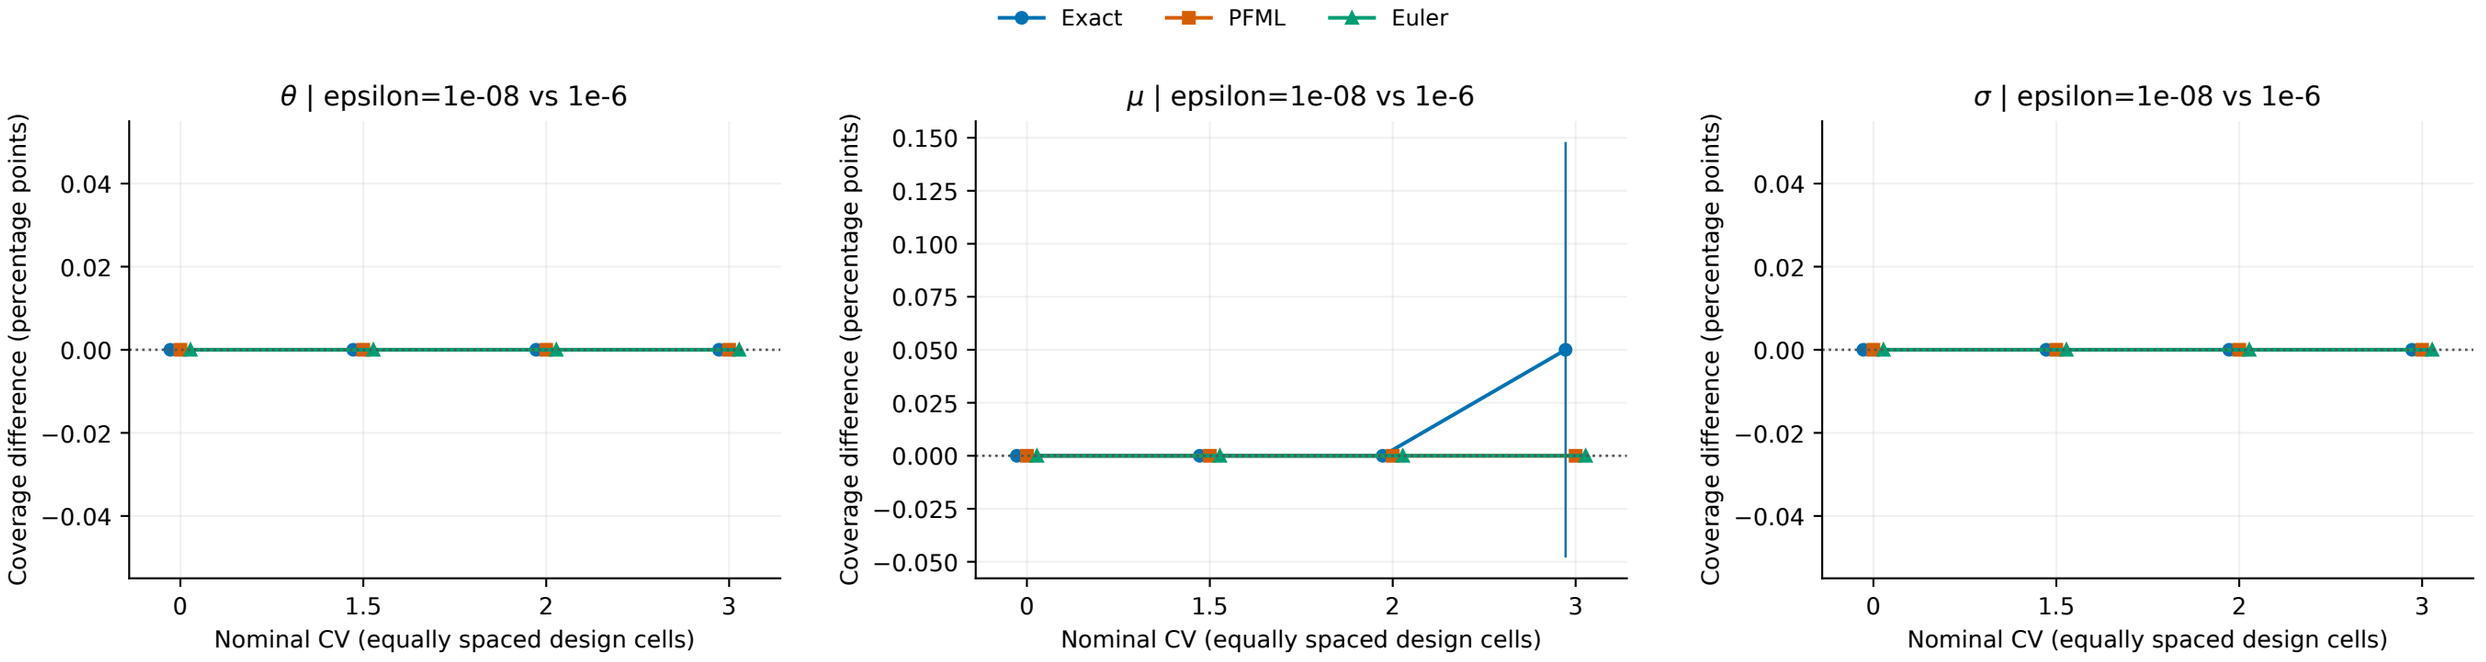
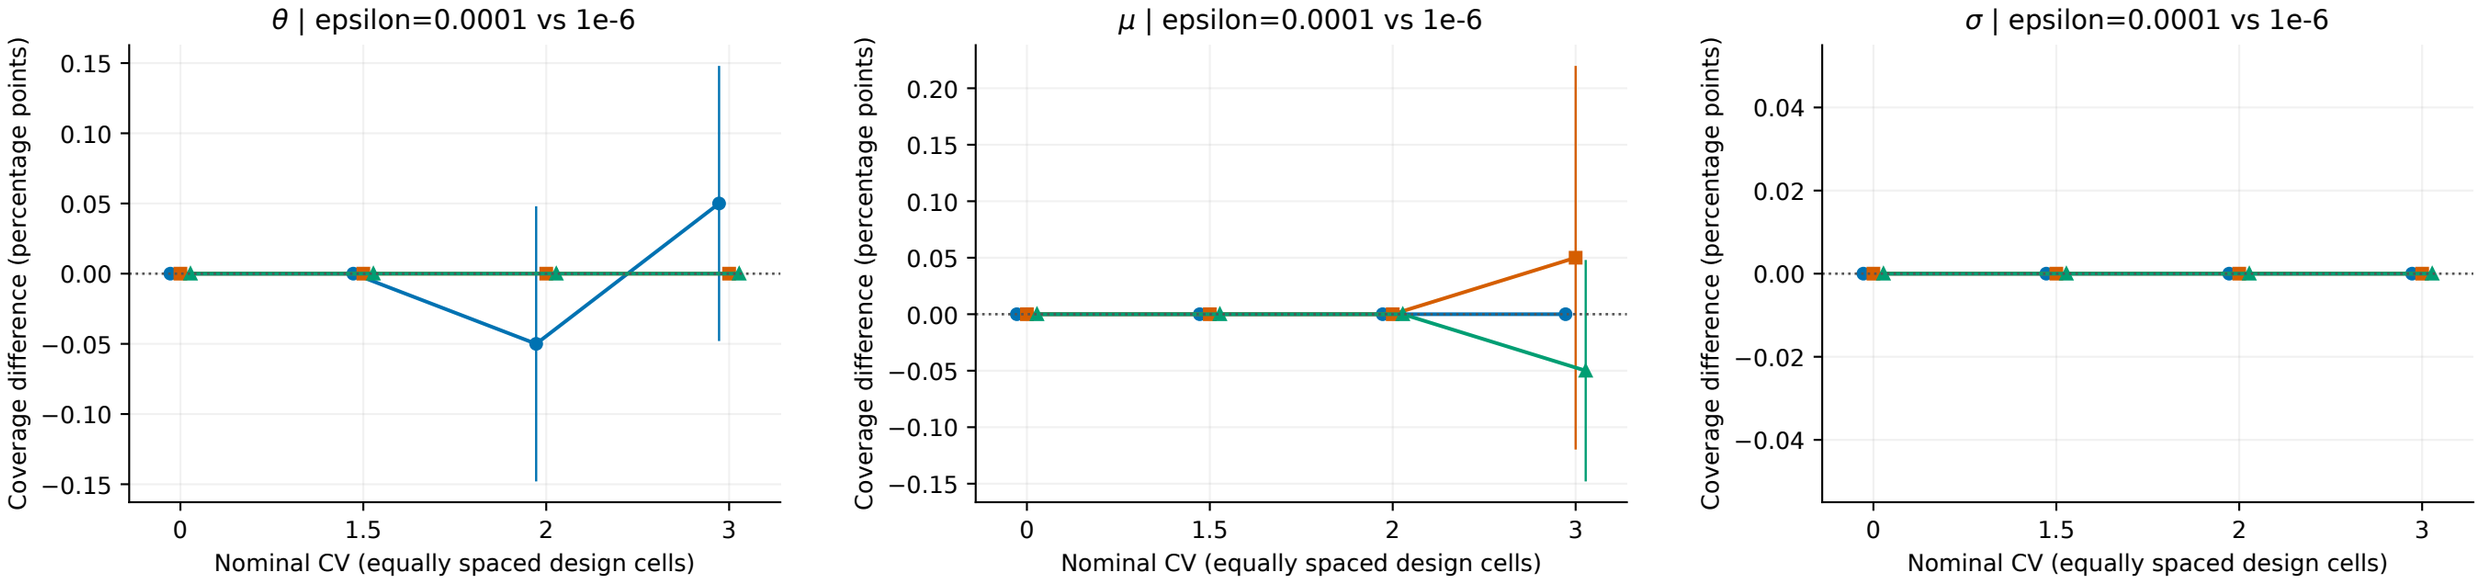
Week 7 Paired floor effects on operational coverage

EXPLORATORY E3 | q=0.5, n=1,000 observations | R=2,000 per physical floor variant





All R=2,000 planned paired paths enter each operational-coverage difference; unavailable intervals count as noncoverage.
Bars: approximate pointwise 95% paired normal Monte Carlo intervals, without clipping to +/-100 percentage points.
Positive means higher coverage under that epsilon than under epsilon=1e-6. CV=0 is an exact shared control, not an independent comparison.
Collapsed normal-MC intervals reflect zero observed variation, not proof of population equality.
PFML/Euler intervals use model-based working covariance. Undefined values are NA gaps; absent bars mean unavailable MC uncertainty.
