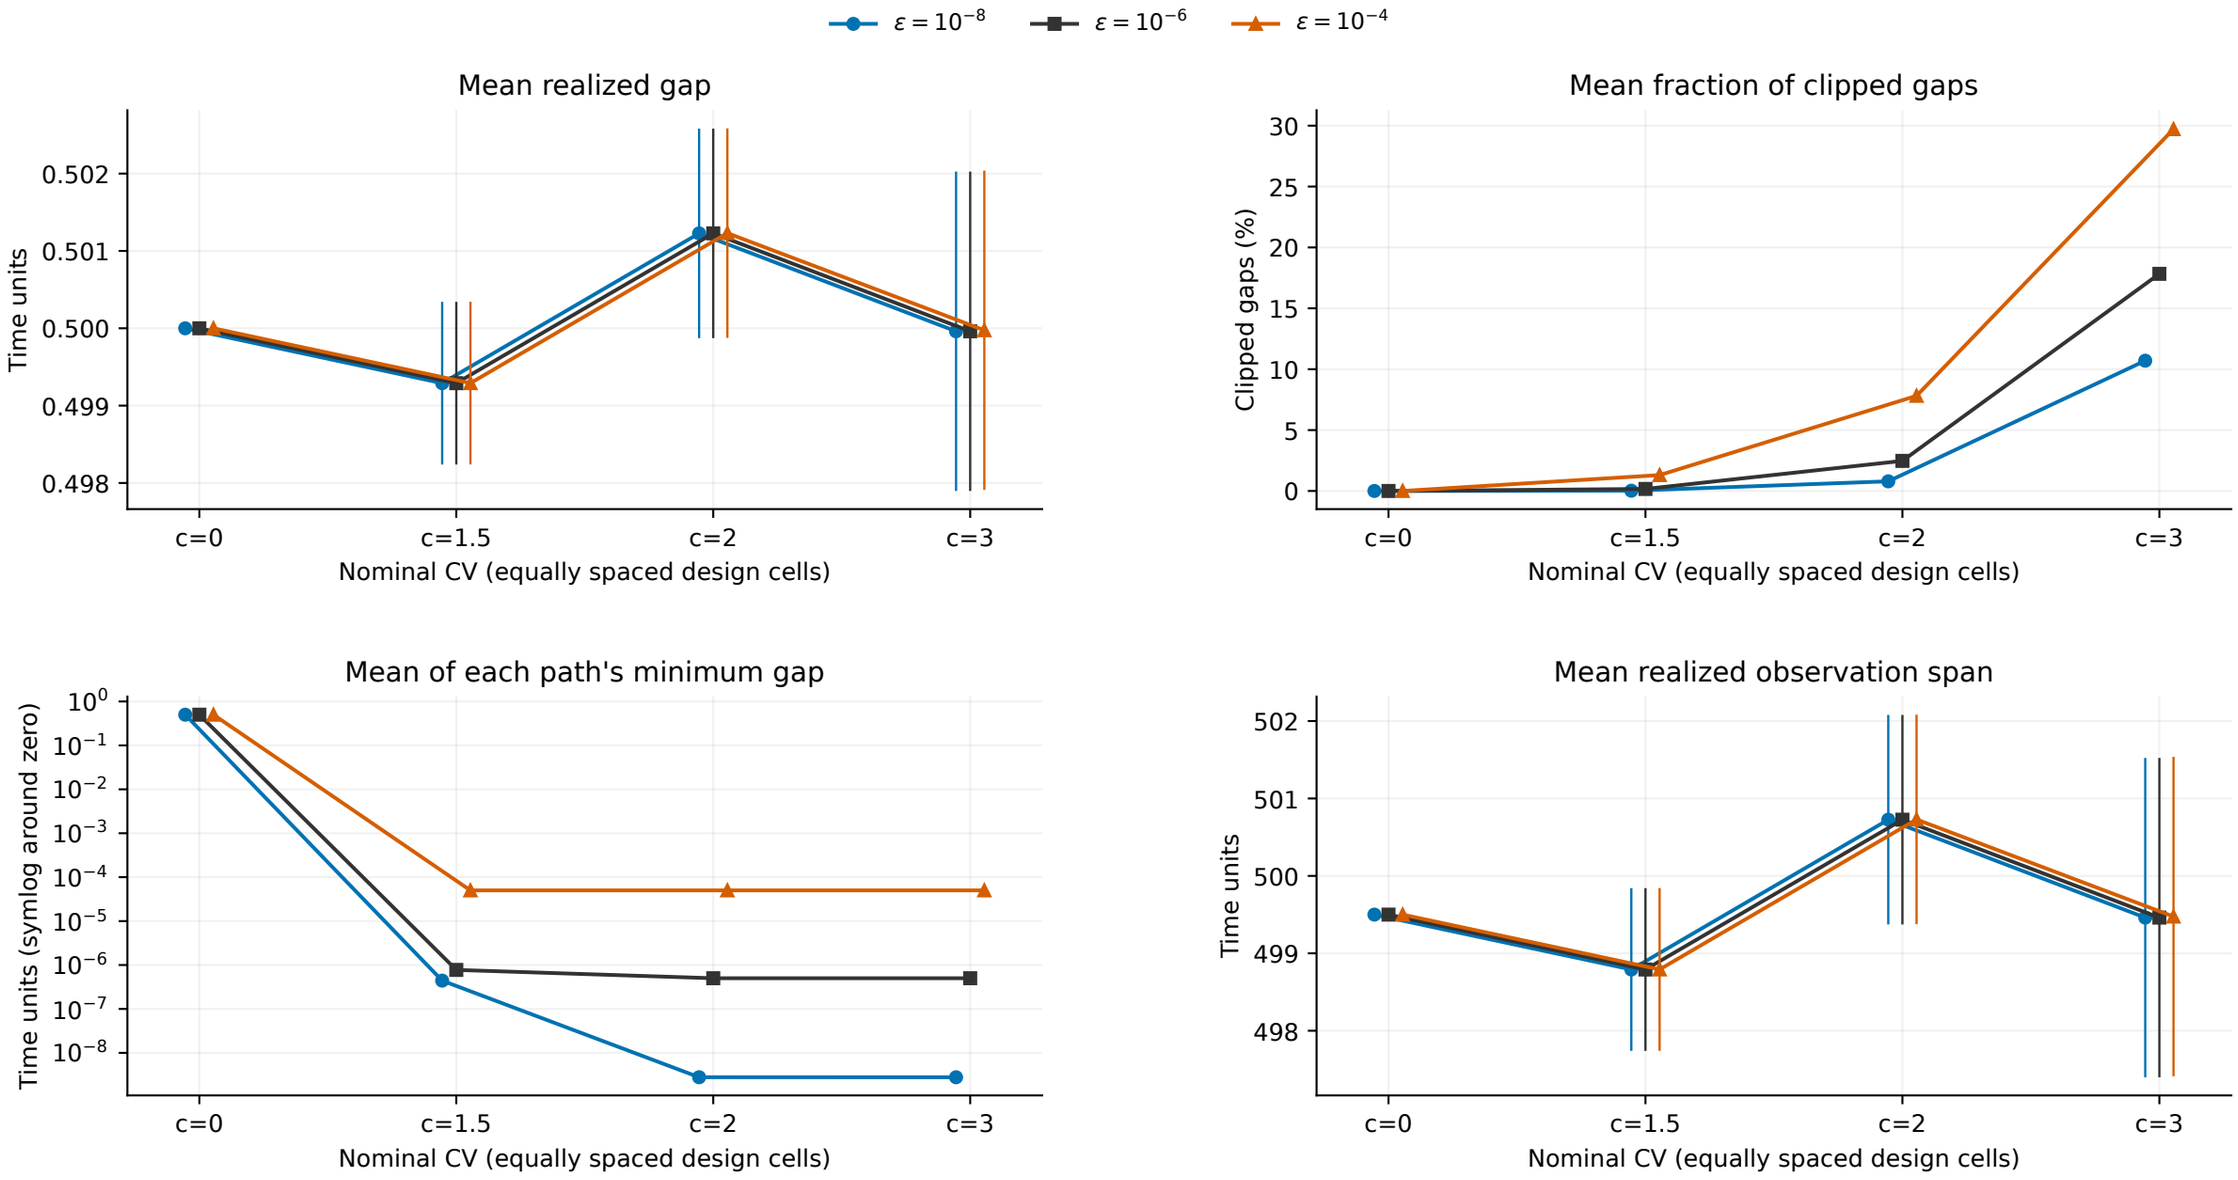
Week 7 Realized spacing under the three floor settings

EXPLORATORY E3 | q=0.5, n=1,000 observations | R=2,000 per physical floor variant



Each summary uses R source paths, not three estimator copies. Bars: approximate pointwise 95% Monte Carlo intervals for each mean.
Minimum-gap panel shows the mean of path minima, not a global minimum; its symlog axis retains normal-MC bounds crossing zero (linear within +/-1e-8).
n counts observations; K=n-1=999 transitions. No renormalization or realized-span matching; realized CV remains in the complete saved table.
All three epsilon variants share Gamma/initial/innovation draws within each CV and replication; the curves are paired. CV=0 is exactly identical.
