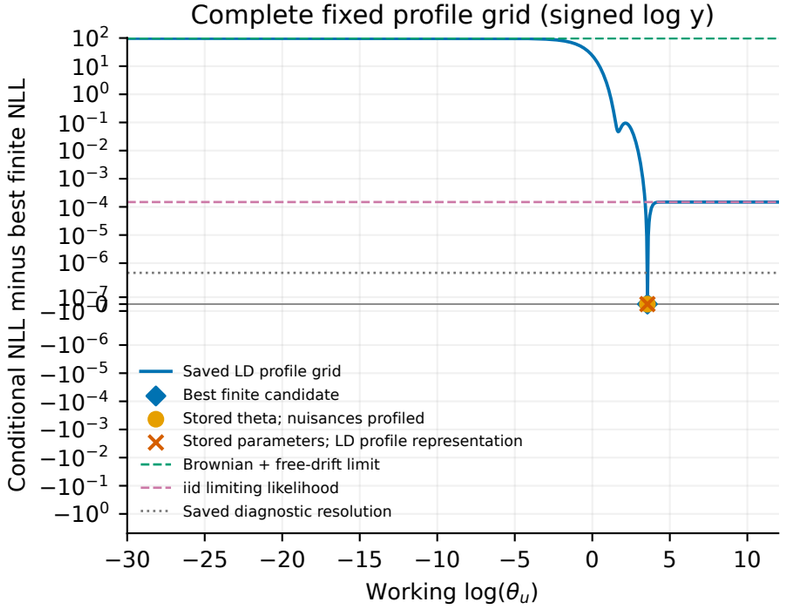
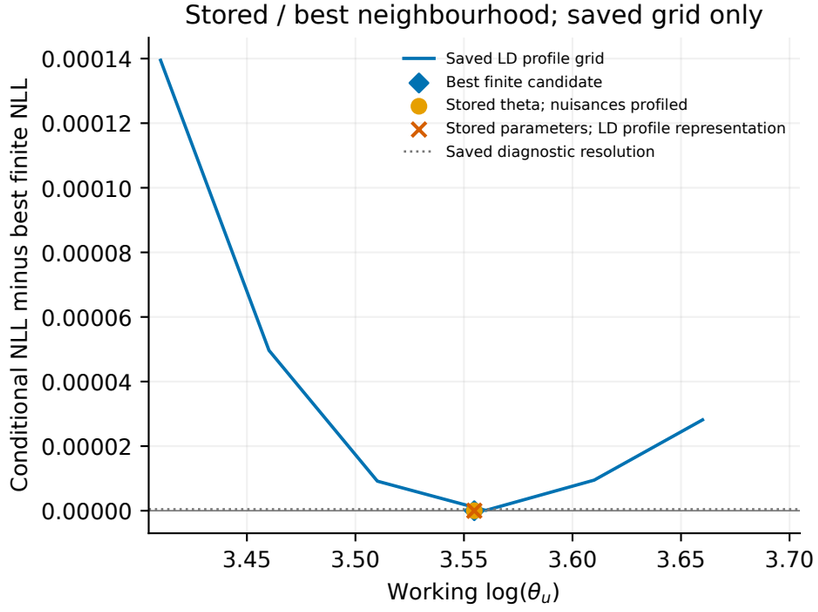
Week 7 Fixed E2 case: CV=0.5, replication 465

EXPLORATORY E3 — saved diagnostics of the original E2 source | q=2, n=250

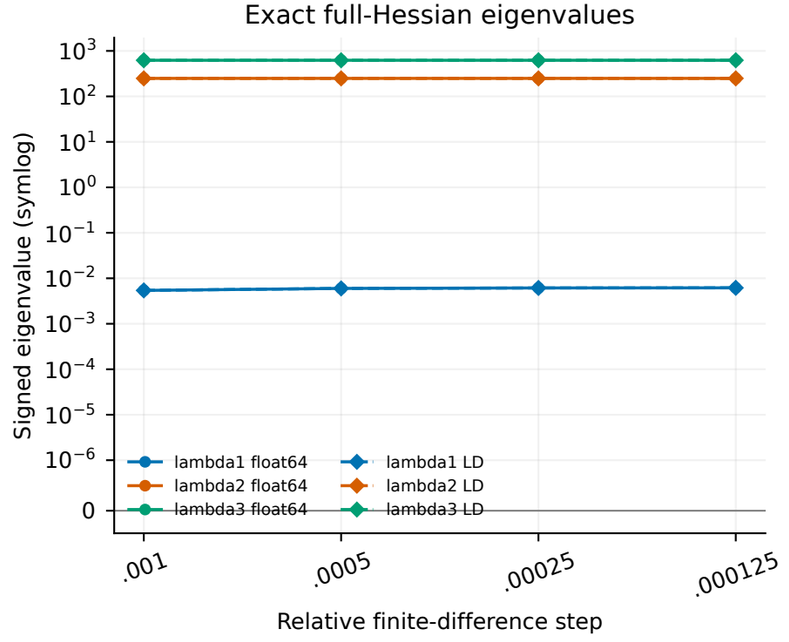
Complete fixed profile grid (signed log y)



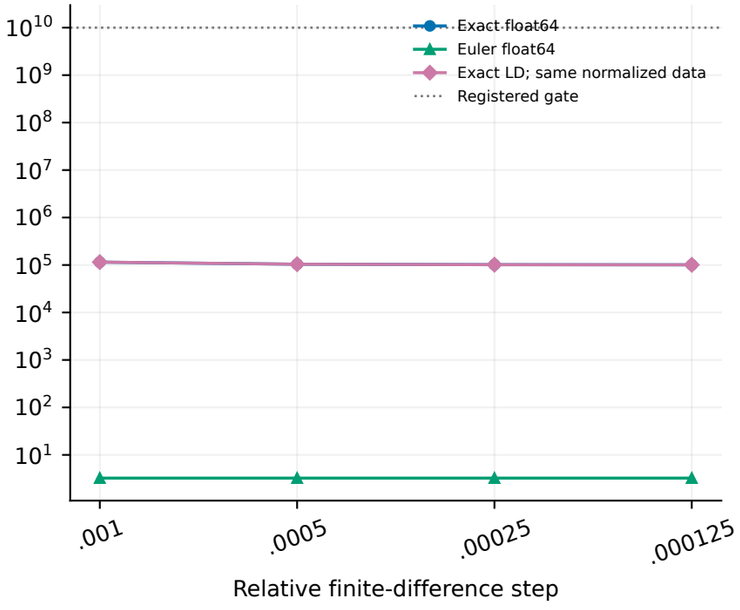
Stored / best neighbourhood; saved grid only



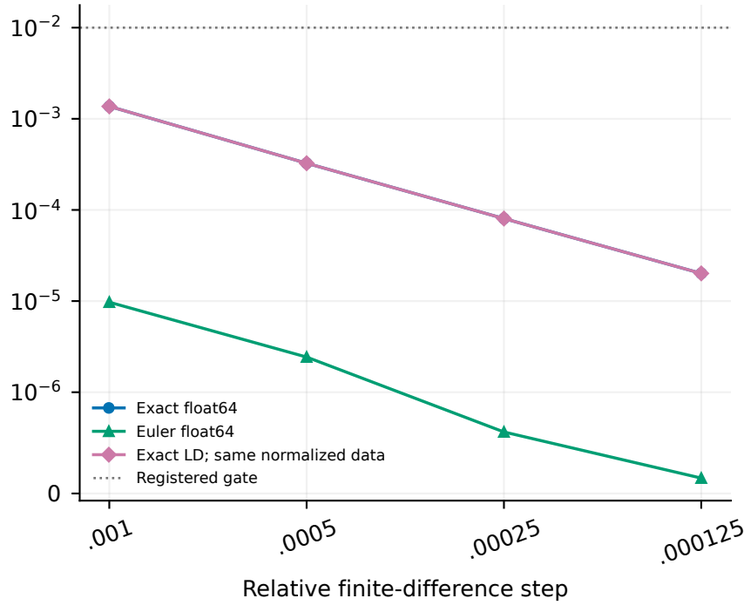
Exact full-Hessian eigenvalues



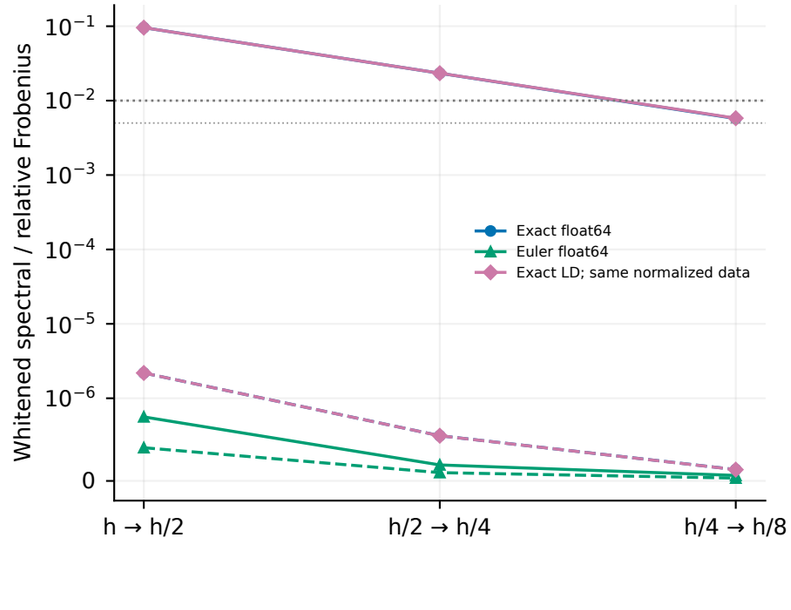
Full-Hessian condition number



Standardized score at stored point



Adjacent-step discrepancy: solid W; dashed F



Original exact point/interval status: valid_interior / unstable_hessian. No replacement fit, interval or covariance.
Saved longdouble: 64 significant binary digits (63 fraction bits), 16 storage bytes; not arbitrary precision.
Registered Hessian ladders use identical float64-normalized inputs; the LD profile normalizes original values/gaps separately.
Saved representation differences: max |delta value|=2.21e-16; max |delta gap|=2.64e-14.
Saved resolution=4.53e-07; lower/upper tail targets reached: True/True. stored full fit matches finite search within diagnostic resolution
Finite searches do not prove a global optimum. Negative saved objective differences are retained, not clipped.
h/2 is the registered matrix candidate subject to all original gates; h/4 and h/8 are diagnostic only. W gate=.01; F gate=.005; score gate=.01.
